

Project Description

The Bright Coffee Shop Sales Analysis project was completed as part of the BrightLearn 2026 Data Analytics Case Study. The project focuses on analysing transactional sales data from a coffee shop to uncover meaningful business insights that can support strategic decision-making and revenue growth.

Using Databricks and SQL, the raw sales data was cleaned, transformed, and analysed to identify key sales patterns, including revenue by product category, product performance, peak sales periods, and customer purchasing trends. The processed data was then exported for dashboard creation and business reporting.

The primary objective of the project was to help the CEO understand which products and time periods contribute most to revenue, identify opportunities for improving sales performance, and provide actionable recommendations to drive business growth.

The project includes:

- Data cleaning and transformation in Databricks.
- SQL-based sales and revenue analysis.
- Creation of transaction time buckets for sales trend analysis.
- Revenue and product performance reporting.
- Interactive dashboards and visualisations.
- Business recommendations based on analytical findings.
- A presentation summarising key insights for executive stakeholders.

This project demonstrates practical data analytics skills, including data cleaning, SQL querying, business intelligence reporting, and communicating insights to support data-driven decision-making.
